

COLLECTION OF BARK BEETLES (CURCULIONIDAE: SCOLYTINAE) FORMED BY PROFESSOR DR. SVETISLAV ŽIVOJINOVIĆ

ČEDOMIR MARKOVIĆ

Faculty of Forestry, University of Belgrade, Kneza Višeslava 1, 11030 Belgrade, Serbia
E-mail: markovicc@ptt.rs

Abstract

One of the major insect collections stored in the depots of the Chair of Forest Protection of the Faculty of Forestry University of Belgrade is the collection of bark beetles formed by Professor Dr. Svetislav Živojinović. It consists of 14 262 specimens collected in the area of the former Yugoslavia, mostly in the territory of Serbia. The collection includes 63 species from 15 tribus and 25 genera. The specimens of 61 species in the collection originate from Serbia, 28 species originate from Macedonia, 21 from Bosnia and Herzegovina, 15 from Montenegro, 12 from Slovenia, and four from Croatia.

This paper presents a list of species in the collection. Based on the label data, each species in the list is described by the data on the locality, date, and host plants on which it was identified, and a number of specimens.

KEY WORDS: bark beetles, Curculionidae, Scolytinae, collection, Svetislav Živojinović

Introduction

The insect collections of the Faculty of Forestry, University of Belgrade are a treasure that can be boasted about. The sizes and wealth of species of the collections arouse the admiration of common people, students, experts and entomologists and make it our duty to respect the great effort, love and work of the people who created them. Unfortunately, a great part of the material within the collections has not yet been researched. Consequently, numerous unpublished data have still to be presented to the scientific public.

One of the major collections stored in the depots of the Faculty of Forestry University of Belgrade is the collection of bark beetles formed by Professor Dr. Svetislav ŽIVOJINOVIĆ. It is one of the largest collections of bark beetles in the Balkans.

Professor ŽIVOJINOVIĆ¹ started the research of bark beetles fauna in 1946. As they are a very significant insect group for forestry, but at that time still faunistically very poorly researched in Serbia and in many other parts of the former Yugoslavia, he wanted to perform detailed research. His intention was to divide the work on their study in two phases. The first phase was the study of the bark beetles fauna of Serbia. The second phase was the extension of the research to other uninvestigated parts of the former Yugoslavia (TOMIĆ & MIHAJLOVIĆ, 2001). The final goal of his research was to publish the fauna of bark beetles of the former Yugoslavia.

To be able to realise his plans, professor ŽIVOJINOVIĆ started the research on bark beetles fauna of the mountains in Serbia (Goč, Golija, Kopaonik, Kosmaj, Maljen, Prokletije, Zlatar, etc.). Simultaneously, he also started to collect material from other parts of the former Yugoslavia. Unfortunately, his unexpected death in 1966 prevented him from completing the planned research of the fauna of this insect group.

After Professor ŽIVOJINOVIĆ's death, the laboratory technician Branko UŽIČANIN B.Sc. organized the great quantity of material collected by the professor and his associates and created a major collection which was named after professor Svetislav ŽIVOJINOVIĆ. Unfortunately, the greatest number of specimens (about 80 %) in the collection was not taxonomically classified, so it was not known exactly what the contents of the collection included. To determine the exact contents, we decided to perform complete taxonomical research, compile a list of professor ŽIVOJINOVIĆ's collection of bark beetles and publish our results in this way.

Material and Methods

The material in Professor ŽIVOJINOVIĆ's collection was collected by him and his associates: B. MAMONTOV, B. PEŠIĆ, D. GRUJIĆ, D. LAKIĆEVIĆ, D. TOMIĆ, D. ŽIVOJINOVIĆ, I. JODAL, J. PAVIĆ, K. VASIĆ, LJ. JANKOVIĆ, M. ILIĆ, M. MAKSIMOVIĆ, M. POPOV, M. ŠILETIĆ, R. MAROVIĆ, S. IDRIZOVIĆ, S. MAMONTOV, S. MILANOVIĆ, S. RADONJIĆ, T. BUNUŠEVAC, and Z. GRADOJEVIĆ.

The work on professor Svetislav ŽIVOJINOVIĆ's collection included:

1. identification of unidentified material;
2. checking of the identification of the already identified material; and
3. cataloguing of the entire collection.

¹ Professor Dr. Svetislav ŽIVOJINOVIĆ was born in the village Čenta (County Zrenjanin) on August 7th, 1907, died in a traffic accident on December 3rd, 1966 when he was 59 years old. He worked as a professor at the Faculty of Forestry University of Belgrade and was a corresponding member of the Serbian Academy of Arts and Sciences. His Doctoral Dissertation "Insect Fauna of the Forest Domain Majdanpek" was defended in 1940 and he became the first Doctor of Forestry Sciences at the University of Belgrade. During the period 1941-1945 he was in captivity in Germany. He was engaged in cultural and educational activities of the prisoners and organised courses in Applied Entomology. After his return, he was devoted to the renewal of the Chair of Forest Protection, especially entomological collections, because the Agricultural-Forestry Faculty of the University of Belgrade was burned during the war. His scientific research was focused on entomo-faunistics, apiculture, biology and ecology of insect pests and the study of parasitoids and predators of insect pests. He published the first textbooks: "Forest Entomology" and "Forest Protection" in Serbian language. He was the Director of the Forestry Department at the Agricultural-Forestry Faculty, University of Belgrade, the Dean and Vice-dean of the Faculty of Forestry University of Belgrade, Chief of the Chair of Forest Protection at the Faculty of Forestry University of Belgrade, Chief of the Department of Forest Protection at the Institute of Forestry and Wood Industry in Belgrade, Chief of the Entomological Department of the Institute of Biology in Belgrade, President of the Society for Plant Protection of Serbia, member of numerous associations and chief editor of several domestic scientific journals. He published more than 100 scientific and professional papers. For his scientific work and research in the field of faunistics, he was awarded by the Government of the National Republic of Serbia in 1949 and decorated with a Work Medal with Red Star for the successful work in science (GAJIĆ, 1985; TOMIĆ & MIHAJLOVIĆ, 2001; VUKŠA, 2009).

Identification of unidentified material and checking the identification of identified material were performed using the keys BALACHOWSKY (1949), STARK (1952), KARAMAN (1971), and PFEFFER (1995).

The catalogue of the collection was made using the database created in the programme Microsoft Office Access. The database is kept at the Chair of Forest Protection of the Faculty of Forestry, University of Belgrade. It contains the following data: species, locality, date, host, collector, identification, number of specimens, and number of the box containing the specimen.

A number of specimens in the collection have no data on the locality, date, host, or collector. As the entire collection was to be listed, such specimens were also included in the list.

Results and Discussion

Professor ŽIVOJINOVIĆ's collection of bark beetles is kept in 51 boxes (45 x 30 x 6 cm) with altogether 14 262 specimens (14 232 identified to the level of species and 30 to the level of genus). The highest number of specimens was collected in the territory of Serbia, and a considerably smaller number was collected in the area of other countries formed by the disintegration of the former Yugoslavia (Table I).

Table I. Numbers of specimens and species in the collection of bark beetles by Professor Dr. Svetislav ŽIVOJINOVIĆ.

State	Total number		
	specimens		species
	number	%	number
Bosnia and Herzegovina	489	3.43	21
Macedonia	2663	18.67	28
Slovenia	401	2.81	12
Serbia	10293	72.17	61
Croatia	11	0.08	4
Montenegro	239	1.68	15
Locality not listed	166	1.16	12
Σ	14262	100	/

The collection of bark beetles by Professor ŽIVOJINOVIĆ consists of 63 species from 15 tribus and 25 genera. Among them, from the trophic aspect, the majority are coniferous species. The percentage of broadleaf species of bark beetles in the collection is considerably lower, both in species number and in the total number of adults. The species that develop on herbaceous plants and climber plants are not found in the collection.

Professor ŽIVOJINOVIĆ's collection of bark beetles is mainly composed of species widely distributed in central and southern Europe (PFEFFER, 1995). It should be noted that almost half its specimens are those belonging to only four very frequent and abundant species in coniferous forests of Serbia: *Ips typographus*, *Pityogenes chalcographus*, *P. bistridentatus*, and *Cryphalus piceae* (Fig. 1).

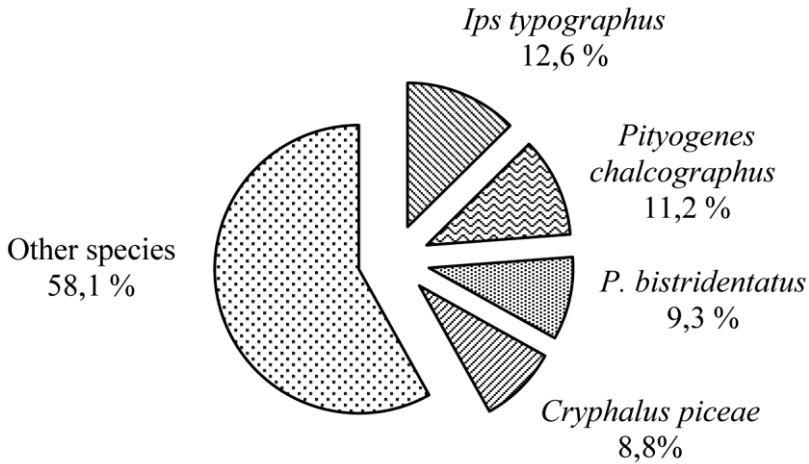

Figure 1. Percentage of specimens of *I. typographus*, *P. chalcographus*, *P. bistridentatus* and *C. piceae* in the collection of bark beetles by Professor Dr. Svetislav ŽIVOJINOVIĆ.

The collection of bark beetles by Professor Živojinović consists of about 70% of species that have already been identified in Serbia (MARKOVIĆ & STOJANOVIĆ, 1997a, 1997b, 1997c, 1999, 2000a, 2000c). It is interesting that some species frequent in broadleaf forests in Serbia (*Scolytus ensifer* Eichhoff 1881, *Taphrorychus villifrons* (Dufour 1843), etc.) are not represented in this collection. This can probably be explained by the fact that the research on bark beetle fauna in Serbia and in other parts of the former Yugoslavia by Professor ŽIVOJINOVIĆ and his associates was focused mainly on coniferous forests because they host the highest percentage of bark beetles, both by the number of species and by the abundance of adults.

The entomologists studying the bark beetles fauna have suspected for a long time that the unresearched material in professor ŽIVOJINOVIĆ's collection contains some species which have still not been identified in the area of the former Yugoslavia. Our results show that these suspicions, at least in the case of Serbia, are justified. Namely, the collection includes two species (*Dryocoetes hectographus*, *Xylechinus pilosus*) which to date have not been identified in the area of Serbia (MARKOVIĆ & STOJANOVIĆ, 1997a, 1997b, 1997c, 1999, 2000a, 2000b, 2000c). In addition, this collection also contains the findings of the species *Ernoporicus caucasicus* and *Orthotomicus longicollis*, which are considerably older than the findings which were reported in the papers by MARKOVIĆ & STOJANOVIĆ (2000a, 2000b) as the first findings from Serbia.

Some data in Professor Živojinović's collection have already been published (ŽIVOJINOVIĆ 1950, 1954, 1960, 1961; ŽIVOJINOVIĆ & ŽIVOJINOVIĆ, 1969; KARAMAN, 1971) and they are also included in the list of species in this paper. Based on the label data, each species in the list is described by the data on the locality, date, and host plants on which it was identified, and a number of specimens. For ease of reference, all tribes and species in the list are presented in alphabetical order and their names are compatible with the names found in the Fauna Europaea (VELAZQUEZ DE CASTRO, 2004).

List of species in Professor Dr. Svetislav ŽIVOJINOVIĆ's collection of bark beetles

Tribe Corthylini LeConte 1876

ЗБИРКА СИПАЦА (CURCULIONIDAE: SCOLYTINAE) ПРОФЕСОРА ДР СВЕТИСЛАВА ЖИВОЈИНОВИЋА

ЧЕДОМИР МАРКОВИЋ

Извод

Једна од највећих збирки инсеката која се налази у депоима Катедре заштите шума Шумарског факултета Универзитета у Београду је збирка сипаца професора др Светислава Живојиновића. На жалост највећи део материјала који се у њој налази до сада није био таксономски обрађен. Како су подаци из ње јако важни за боље познавање фауне сипаца Србије збирка је у потпуности таксономски обрађена и пописана а добијени резултати су у овом раду представљени.

Збирка сипаца професора др Светислава Живојиновића садржи 14 262 примерака који прикупљени на подручју некадашње Југославије, највећим делом на територији Србије. У њој се налазе 63 врсте из 15 трибуса и 25 рода. За 61 врсту у њој постоје примерци из Србије, за 28 из Македоније, 21 из Босне и Херцеговине, 15 из Црне Горе, 12 из Словеније и 4 из Хрватске. По први пут за фауну сипаца Србије у овој збирци су пронађени налази врста *Dryocoetes hectographus* и *Xylechinus pilosus*. Такође, у њој су нађени и налази врста *Ernoporicus caucasicus* и *Orthotomicus longicollis* који су знатно старији од налаза које као прве за Србију у својим радовима наводе MARKOVIĆ & STOJANOVIĆ (2000a, 2000b).

У резултатима овог рада наведен је списак врста које се у збирци налазе. За сваку од њих су, на основу података из збирке, наведени локалитети, датуми и домаћини на којима су оне констатоване и број примерака.
